# A New Energy

by

**piero b. & mila solaris**

The beginning of 2020 marked a historic turning point for humanity: a global economic collapse began, which has roots dating back many years, and which will lead to a total and permanent transformation of today's social and financial situation. The globalists: the elite who currently have planetary control over the financial, monetary, military and communication systems, have decided to conduct this collapse through the total manipulation of the masses, thanks to the power they possess over the media, as well as their virtually unlimited financial resources. This farce of a "pandemic" has been possible thanks to the gradual and ever greater "medicalization" of the population carried out in recent decades, medicalization made possible by the gradual takeover of world medical research by the globalists. The almost total control of the population was achieved through fear of the "disease" (problem) and would come to be partially resolved with the periodic administration of a "magic" vaccine (solution). Once "installed", the globalist Elite would most certainly not abandon this Nazi-medical control system in the future, they would keep it to allow for the impoverishment and exploitation of the masses, whilst simultaneously, among other objectives, allowing the **controlled demolition** of the economy as we have known it. This historical phase of collapse, which in the past has generally come to coincide with wars of varying scales of devastation, has been necessary to cleanse the economy from the deadly financial "toxicity" caused by the monetary manipulation of the monetary monopolists. Anyone familiar with the Austrian School of Economics is well aware of the causes and effects of this manipulation. Those who understand it, have been preparing for the "impact" of the incoming economic and social "burst": through accumulation of goods and resources in order to avoid problems from the collapse of supply chains, as well as accumulation of precious metals and cryptocurrencies to avoid impoverishment as a result of the world's monetary inflation.

However, to date, no one among those who have developed a clear awareness of what is happening seems to worry (or at least not worry enough) about what will happen to the **energy production systems** that are the base of all world economic systems, from the most primitive to the most advanced. In fact, the current world globalist monopoly does not only have control over the media, the monetary and financial systems and the medicine industry, but also (and above all) energy.

The world economic system is still dependent on the "dollar-oil" binomial monopoly and the applications of truly decentralized, so-called "renewable" energies are still extremely low, which is of course intentional in order for the globalists to have control and global power.

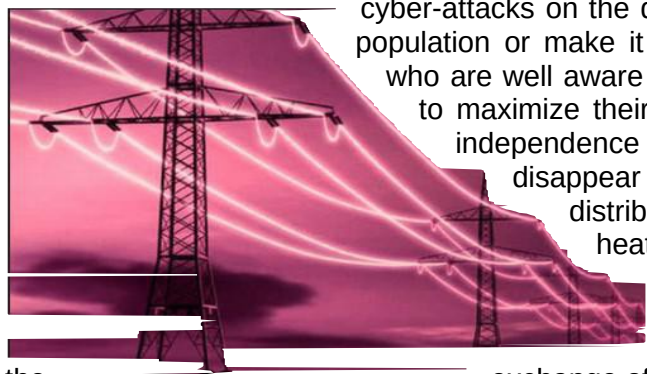

The globalist narrative: the "Great Reset", expresses a "need" to shift the energy system towards "green" production and distribution models, but without explaining how, with what technologies and with what real sustainability. The shift towards this alleged new paradigm, according to the globalist elite of the WEF (World Economic Forum), will in reality take place according to a centralized energy control mechanism that must never be distributed and usable according to free market laws, but must always have strict and well-regulated control by those who hold power and have no intention of losing it.

## quartattenzione.net

For those who have wanted to see it, the "pandemic" has made the level of manipulation of the economic and medical sciences clear and transparent, revealing how they have been manipulated and distorted for decades so as to preserve the control of the few at the expense of the many. **The same has happened for over a century with energy**, at both the level of scientific and industrial research, without being able to take steps towards changing this state of affairs. This is because, similarly to what has happened in the field of social, economic, monetary and medical sciences, research and technological development around energy have been systematically manipulated, distorted and suppressed in order to prevent the development of any alternative that could oppose the current system of economic and financial slavery in which we live.

Yet to this day, unfortunately, the control of energy is still firmly in the hands of the globalist elite who can at any time and under any pretext (as seen in the recent announcements of alleged cyber-attacks on the distribution networks) take energy away from the population or make it extremely expensive. Meaning that even those who are well aware of the current world situation and who are trying to maximize their independence from the system, could see this independence painstakingly conquered, and suddenly disappear due to the blocking or reduction of energy distribution. Without energy it is not possible to travel, heat or cool a house, cultivate land beyond a simple level of subsistence or communicate at a distance. Nor can decentralized monetary systems, like Bitcoin (which need energy for the exchange of transactions and for mining), work.

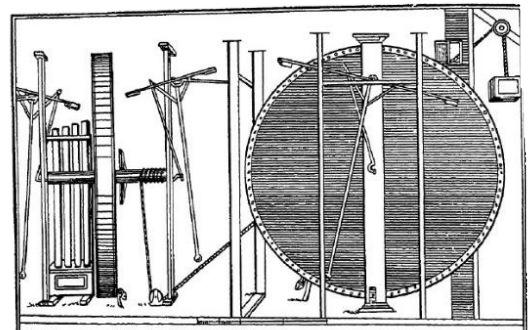

**In fact, the centralized control of energy indirectly determines the control of all human activities in an even more invasive way than the control of money.**

*But how was it possible to get to this point, and above all, is there a solution?*

For over a century, the paradigm (from which this control has been developed) has been to allow only the study and development of **"closed" systems**. That is, systems in which the energy introduced into the system is partially used and immediately destroyed (short circuited) and cannot be recoverable in any way. An example is that of cars' eso-endo-thermic engines, these use only a very small amount of energy from the hydrocarbons (oil) to create traction, of which up to over 70% is dispersed through heat, making it completely unusable and not recoverable.

**"Open" systems**, on the other hand, work by using and continuously recycling the energy present in the environment which, if properly designed and built, allow for a **totally autonomous production**, meaning that they do not require a continuous input of energy like closed systems do.

This would clearly allow for a "decentralization" of energy production which, as can be imagined, has never been liked by the elite globalists who currently control oil production and extraction systems, all thanks to the never-ending war.

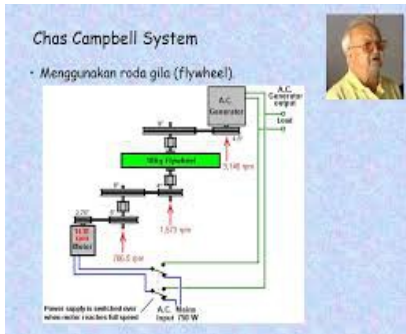

**Ohann Ernst Elias Bessler**, known as **Orffyreus**, was one of the first known inventor-builders capable of creating a completely mechanical "open system" utilising the gravitational pull.

**quartattenzione.net**

His studies have been recently, either knowingly or unknowingly, taken up and carried out by Chas Campbell (<http://www.ijsrd.com/articles/IJSRDV4I21508.pdf>) and by Veljko Milkovic (<https://www.veljkomilkovic.com/indexEng.htm>).

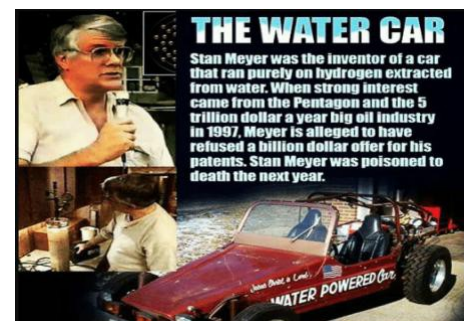

However, the first man to systematically study these "open systems" was **Nikola Tesla**, who since the end of the 1800s, after having created the first alternating current supply systems, focused on the possibility of extracting energy from the environment and transmitting it at a global scale. After Tesla, many researchers conducted studies and made patents, but all the research on "open" systems aimed at taking advantage of the environment's enormous energy potential (thus making it easily usable and decentralized) was systematically demolished and suppressed. Over the years, after Tesla, many researchers proposed solutions and made patents for "open" energy systems (known improperly as "free energy" systems). Among these we can reference:

**Paharamansa Tewari**

## quartattenzione.net

**Fleischmann and Pons:** In 1989 they developed a technology to carry out nuclear fusion in an electrolytic cell, ([https://lenr-canr.org/wordpress/?page\\_id=263](https://lenr-canr.org/wordpress/?page_id=263)), originally called **cold fusion**, but later renamed LENR (low energy nuclear reactions).

### Donald Lee Smith

(<http://www.free-energy-info.co.uk/SChapter31.pdf>)

Many others have been researchers in the field of open energy systems, but they have all, inexorably and without exception, (in the best of cases) been ignored, or (in other cases) disparaged and made to fail in their business ventures, or even physically eliminated.

See the story of Joseph Newman told through this movie:

([https://www.amazon.com/gp/product/B01N658PX2?](https://www.amazon.com/gp/product/B01N658PX2?ie=UTF8&tag=maimounas-20&linkCode=as2&camp=1789&creative=9325&creativeASIN=B01N658PX2)

[ie=UTF8&tag=maimounas-20&linkCode=as2&camp=1789&creative=9325&creativeASIN=B01N658PX2](https://www.amazon.com/gp/product/B01N658PX2?ie=UTF8&tag=maimounas-20&linkCode=as2&camp=1789&creative=9325&creativeASIN=B01N658PX2))

## The Problem

The disinformation and the constant suppression of fundamental scientific and technological principles, which are useful for taking advantage of the energy from **open systems or free energy**-, has made the dissemination of knowledge (useful for developing, producing and marketing the related technological equipment) extremely difficult and expensive. Any industrial initiative relating to such equipment has so far failed, as it is relatively simple for the globalist monopolists to suppress any private initiative that requires initial investment capital and permission to spread. The control of the university and professional technical training courses by the elite has ensured, until now, that only a few curious non-aligned individuals studied and developed small working prototypes. However, to date, none appear to have really achieved the industrial production of free energy equipment. Something similar happened in the field of money, with the first experiments of electronic money such as **e-gold**, which were all suppressed because they were developed by easily identifiable and suppressible companies.

However, soon later came Bitcoin and the world of money changed.

## The Opportunity

The solution to the problem (the suppression of technology of open energy systems) is **the decentralization of energy production**. How do we achieve this?

1. **Spreading knowledge:** it is possible to spread the suppressed knowledge on energy by having them systematized and tested;
2. **Optimization:** it is possible to optimize and make conventional energy production systems much more efficiently thanks to the above knowledge;
3. **Incentives:** it is possible to promote the spread of open energy production systems by creating production incentives. The main incentive today is the possibility of becoming energetically autonomous, be it in remote areas of Earth, be it in the middle of the sea, or anywhere else a community might intend to take refuge throughout this historical period. Nonetheless, **thanks to the current adoption of cryptocurrencies worldwide, the creation of a new money-energy binomial is a huge incentive in itself.**

**The new crypto-energy binomial: the true decentralization of the monetary and economic system**

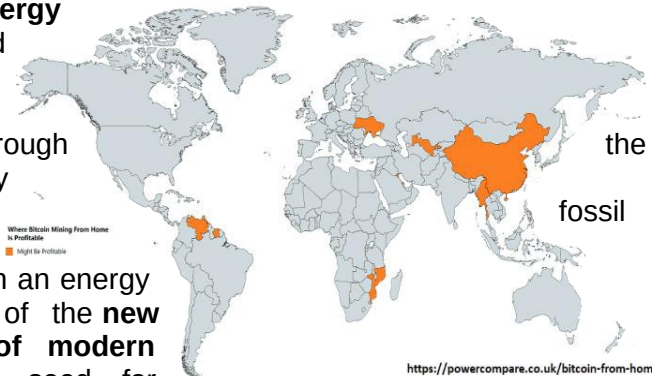

**quartattenzione.net**

Global power is firmly in the hands of a few because the control of the centralized **money-energy binomial (dollar-oil)** is still fully operational. The oil market is also the basis for a large part of the development of pharmaceutical chemistry, which, in turn, is the cause of the current total distortion and manipulation of medical science, as well as agronomic sciences and management of food production processes (Monsanto).

However, thanks to bitcoin and cryptocurrencies it has been possible to start the decentralization of monetary power which has begun to create economic and financial freedom, without yet having been able to start a real **new money-energy binomial** along with the advantages that would derive from it. Only this new binomial can become the basis for gradually unhinging the current dollar-oil binomial over time. How? Through the creation of extremely optimized energy systems that are scarcely dependent on energy production or **even completely independent and autonomous**, to be used in an energy production network at the direct service of the **new decentralized monetary system made of modern cryptocurrencies**. This would plant the seed for the **gradual demolition (or at the very least, the downsizing)** of the current dollar-oil binomial.

The Only 10 Countries Where You Might Be Able To Mine Bitcoins From Home Profitably

the fossil

<https://powercompare.co.uk/bitcoin-from-home/>

Free and decentralized energy would not only produce direct utility in homes or companies, but it would also be used (wholly or partly) for powering decentralized monetary nodes or for mining. **The incentive for the development of this system would be parallel to the economic incentive that determined the success of Bitcoin** and all other cryptocurrencies. In fact, the use and production of the equipment for the functioning of the monetary system **would be incentivized by the reward from mining and transaction fees**.

Currently, the decentralization of bitcoin and proof of work-based cryptocurrencies is put at risk precisely by the centralized control of energy. The profitability of Bitcoin mining, due to the current energy costs of fossil fuels, is possible in only **10 countries in the world** and is **mainly concentrated in China**. Not exactly a country you would expect to uphold maximum respect for individual freedoms.

For this reason, the dependence on the centralized global energy production system can become a serious problem for economic and monetary freedom, especially in this historical period, and for this reason it is necessary not to underestimate the risks that the current **centralized control of energy** can present for Bitcoin and the ecosystem of all cryptocurrencies, as well as for economic freedom in general.

**Only a new, truly decentralized crypto-energy binomial could become unattackable or uncensorable**, as it would be widespread globally, as well as anonymous and sustainable, making Bitcoin and other cryptocurrencies almost totally unassailable by governments and the globalist elite.

### What does it take to create energy decentralization?

1. *Training and dissemination of knowledge in the field of open systems;*
2. *Technical support for the optimization of existing renewable energy systems;*
3. *Investments for industrial research and prototyping of free energy equipment for the creation of the new crypto-energy binomial;*

**quartattenzione.net**

*4. The study and development of energy systems for medicine and biology.*

**This newsletter** aims to introduce the first components of new energy hitherto hidden, to provide information on how to increase the efficiency of existing equipment and organize investment mechanisms useful for the construction of equipment for a crypto-energy binomial, as well as the production of energy equipment for individual use in even the most diverse fields, including those of medicine and biology. The goal is the creation of a concrete and applicable knowledge on the subject of "**New Energy**", from which it will be possible to create truly autonomous, sustainable and incentivizing mechanisms of production and technological development, allowing for the transfer of wealth (which today is in the hands of global energy monopolists) towards all those who intend to actively participate in this technological revolution.
